## Industrial and technology parks

Industrial and technology parks are commonly regarded as a policy panacea. They tend to be considered as the ideal instrument to alleviate an assortment of institutional, political, economic, social and ultimately, technological weaknesses and often form the centrepiece of development strategies. Yet, the real impact of industrial and technology parks, especially in emerging countries is still poorly understood. Focusing on examples from Latin America, Asia, Africa and the Middle East, the book represents a first approach to understand the potential and reality of industrial and technology parks in emerging countries. It is argued that although some parks have been successful in addressing a range of key problems, including underdevelopment, unemployment and a lack of investment, the majority have failed to deliver, rendering the promise of many parks little more than a pipedream.

Integrating cognitive behavior therapy (CBT) with hypnosis may increase benefits to clients suffering from a broad range of mental and physical health problems. This practitioner's guide, written by some of the most influential clinical psychologists, educators, and hypnotists, brings together these two methods of treatment and provides a theoretical framework for this integration. By thoroughly reviewing the evidence-based research for the addition of hypnosis to cognitive behavioral treatments and illustrating a variety of clinical applications, the contributors show how the integration can mean productive treatment of clients who might otherwise not have progressed as quickly or successfully. A useful final chapter addresses the process of becoming a practitioner of both CBT and hypnosis.

Our responses to our thermal environment have a considerable effect on our performance and behavior, not least in the realm of work. There has been considerable scientific investigation of these responses and formal methods have been developed for environmental evaluation and design. In recent years these have been developed to the extent that detailed national and international standards of practice have now become feasible. This new edition of Ken Parson's definitive text brings us back up to date. He covers hot, moderate and cold environments, and defines these in terms of six basic parameters: air temperature, radiate temperature, humidity, air velocity, clothing worn, and the person's activity. There is a focus on the principles and practice of human response, which incorporates psychology, physiology and environmental physics with applied ergonomics. Water requirements, computer modeling and computer-aided design are brought in, as are current standards. Special populations, such as the aged or disabled and specialist environments such as those found in vehicles are also considered. This book continues to be the standard text for the design of environments for humans to live and work safely, comfortably and effectively, and for the design of materials which help the same people cope with their environments.
