Pier 15 | Exploratorium

The Exploratorium’s move to Pier 15 provides a prime waterfront location for this internationally acclaimed museum of science and perception. Situated midway between Ferry Plaza and Fisherman’s Wharf, the new Exploratorium brings to life a previously dormant stretch of San Francisco’s historic Embarcadero waterfront.

The Exploratorium at Pier 15 Project | EHDD Architects SF

The Exploratorium is an internationally known science museum focused on hands-on exhibits of natural phenomena. They recently moved to this new location, carefully restoring the historic Pier 15 on San Francisco’s downtown waterfront. Visitors can now experience 80,000 square feet of science exhibits in the historic structure, with new cafes and event space located in the contrasting modern glazed observatory with unobstructed views of San Francisco Bay.

The Exploratorium: Pier 15, San Francisco, CA

There is a lot of excitement about the recently built 330,000 square foot Exploratorium Museum at Piers 15 and 17 in San Francisco. These historic piers were built in phases over the past 100 years and needed to be seismically retrofitted and renovated before the museum could consider this stunning location.

The exhibits are housed in and around Pier 15, which extends over 800 ft (240 m) over the Bay. The Exploratorium at Pier 15 was designed by architecture firm EHDD. Nibbi Brothers served as the General Contractor, and AGA (Architectural Glass and Aluminum) as the Glazing Contractor. The piers had been neglected for decades leading up to the Exploratorium’s move, and extensive renovation and repair was required.

The Art of Tinkering is a collection of exhibits, artwork, and projects that celebrate a whole new way to learn, in which people create their own knowledge through making and doing, working with readily available materials, getting their hands dirty, collaborating with others, problem-solving in the most fun sense of the word, and, yes, oftentimes failing and bouncing back from getting stuck. Each artist featured in The Art of Tinkering goes through this process, and lovingly shares the backstory behind their own work so that readers can feel invited to join in on the whimsy. Whether it’s sharing their favorite tools (who knew toenail clippers could be so handy?) or offering a glimpse of their workspaces (you’d be amazed how many electronics tools you can pack into one pantry!), the stories, lessons, and tips in The Art of Tinkering offer a fascinating portrait of today’s maker scene.

As human populations inhabiting cities have grown dramatically, we have lost the ability to understand and even to see the natural world around us. We lack the vocabulary to describe our surroundings, and this lack of understanding limits our ability as citizens to contribute to political decisions about the landscape of cities, especially at the edges where land meets water. Bay Lexicon, a field guide to San Francisco's shoreline, is a case study in establishing a working language for hybrid landscapes. Centred on a walk along the edge of the iconic San Francisco Bay, it documents, deciphers, and classifies the places and phenomena a person encounters – and the forces, histories, and interactions that underlie what is visible. In a unique synthesis of text and drawing, Jane Wolff applies analytical and representational tools based in design and documentary work to findings from the fields of geography, environmental and cultural history, public policy, urban ecology, and landscape studies. As our cities face increasing pressure caused by climate change, we will need to reimagine them in terms that do justice to their complexity. Bay Lexicon's methods for building landscape literacy are meant for translation, adaptation, and use far beyond San Francisco Bay. Through activist scholarship that cuts across disciplinary boundaries and levels of expertise, this book examines how the landscape at the water's edge works, documents its historical evolution, brings its citizens' values to light, and frames conversations about how and why it might change.

Kids and teachers can build their own science projects based on exhibits from San Francisco's premiere science museum This revised and updated edition offers instructions for building junior versions, or "snacks," of the famed Exploratorium's exhibits. The snacks, designed by science teachers, can be used as demonstrations, labs, or as student science projects and all 100 projects are easy to build from common materials. The Exploratorium, a renowned hands-on science museum founded by physicist and educator Frank Oppenheimer, is noted for its interactive exhibits that richly illustrate scientific concepts and stimulate learning. Offers a step-by-step guide for building dynamic science projects and exhibits Includes tips for creating projects made from easy-to-assembly items Thoroughly revised and updated, including new "snacks," images, and references

Art publication regarding site specific installation at the Exploratorium by artist Tim Hawkinson.

A must for exhibit developers, researchers, educators, and other museum professionals looking for ways to engage visitors more deeply with interactive science exhibits, this book documents the exploration and findings of the Exploratorium’s Active Prolonged Engagement project, funded by the National Science Foundation. Both a significant contribution to visitor research and a nuts-and-bolts guide to exhibit development, Fostering Active Prolonged Engagement includes 15 APE Tales (exhibit recipes with photos, drawings, and detailed construction specifications); discussions of setting explicit goals for visitors’ exhibit experiences; research and evaluation methods and results; and lessons learned for building constructivist-style exhibits.

Cole--a friend and colleague of Frank Oppenheimer's for many years--has drawn from letters, documents, and extensive interviews to write a very personal story of the man whose irrepressible spirit would inspire so many.

This book explores the effects of incorporating inquiry- and narrative-based video clips into interactive science museum exhibits in order to make them more personally meaningful for visitors.

Let science blow your mind with the Exploratorium! Take a good look around: The ho-hum spots you inhabit every day are actually secret laboratories full of fascinating and eye-popping wonder—from the instant you wake up to the time you nod off at night! Discover these awe-inspiring scientific playgrounds with Exploralab—the hands-on, action-packed activity guide from the world’s most beloved and fun-filled laboratory of all, the Exploratorium in San Francisco. Exploralab contains tons of way-cool tools of inquiry to help kids get in on the science fun, including: • a magnifier • reflective paper • fabric swatches • an erasable whiteboard • textured paper • a spinning disc • polarizing filters • colored acetate sheets • and glow-in-the-dark ink!

A gleefully gruesome look at the actual science behind the most outlandish, cartoonish, and impossible deaths you can imagine What would happen if you took a swim outside a deep-sea submarine wearing only a swimsuit? How long could you last if you stood on the surface of the sun? How far could you actually get in digging a hole to China? Paul Doherty, senior staff scientist at San Francisco’s famed Exploratorium Museum, and writer Cody Cassidy explore the real science behind these and other fantastical scenarios, offering insights into physics, astronomy, anatomy, and more along the way. Is slipping on a banana peel as hazardous to your health as the cartoons imply? Answer: Yes. Banana peels ooze a gel that turns out to be extremely slippery. Your foot and body weight provide the pressure. The gel provides the humor (and resulting head trauma). Can you die by shaking someone’s hand? Answer: Yes. That’s because, due to atomic repulsion, you’ve never actually touched another person’s hand. If you could, the results would be as disastrous as a medium-sized hydrogen bomb. If you were Cookie Monster, just how many cookies could you actually eat in one sitting? Answer: Most stomachs can hold up to sixty cookies, or around four liters. If you eat or drink more than that, you’re approaching the point at which the cookies would break through the lesser curvature of your stomach, and then you’d better call an ambulance to Sesame Street.
