The pro-106 is a Digital Trunk Tracking scanner has the ability to track APCO 25 digital trunking systems, in addition to following Motorola type I/II systems, LTR and EDACS trunking systems. It is functionally identical to the PSR-500 and the later Whistler WS1040. It uses the same software and cables.

Pro-106 - The RadioReference Wiki

The PRO-106 design is a few years old now, and no longer in production, but it is an excellent scanner for most purposes. The object-based memory system provides an excellent level of flexibility; any object (channel) can be assigned to any or all of the 20 memory banks and the size of each bank is fully customizable.

Herbicides are the dominant technology and the most effective weed control tools ever developed that are used for the control of weeds that infest crops. Over the last several decades, in situations of intense herbicide usage, there have been many examples of the evolution of weed populations resistant to herbicides. Weed adaptations to management tactics, including biochemical mimicry in the form of evolved resistance to the herbicides used for weed control, have increased rapidly throughout agriculture and now threaten global food security. Nowadays, expended space of research activities remains to focus on the herbicide resistance to weeds and crops. The authors of Herbicide Resistance in Weeds and Crops cover various issues regarding the present relevant research.

Major General Orde Wingate (1903-1944) was the most controversial British military commander of the Second World War, and perhaps of the last hundred years. Anglim's biography fills a significant void in the literature, making extensive use of Wingate's papers to place him firmly in the context of the British army of the time.

"Weeds are rarely considered a priority despite the fact that all active farmers know that the majority of their variable costs and time are devoted to eradicating them. Even most crop losses due to pests can be traced directly back to weeds, which harbor the pests as secondary hosts. In the *Molecular Biology of Weed Control*, Jonathan Gressel focuses attention upon the tools of molecular biology that can be used effectively in the science of weed control. Always keeping his perspective congruent with that of the working farmer, Gressel explains how weed biologists and ecologists are beginning to use recently developed tools to control intransigent weed species in modern as well as less developed areas of the world. With his usual candor, Gressel evaluates past efforts, while also exploring future prospects for replacing chemical herbicides with genetic engineering, to improve a crop's ability to compete against its feral cousins for light, nutrients, and water. Like much of Gressel's work, this book should be mandatory reading for all agriculturists and plant scientists, so that they employ and encourage what is truly effective and efficient in meeting one of this century's most critical challenges: maximizing agricultural productivity.
